

In the Claims

Claims remaining in the application are as follows:

1. (Currently Amended): A storage system comprising:
a storage array containing a plurality of storage devices of at least three distinct types including volatile solid-state and non-volatile disk types in a single array and having a respective class hierarchy; and
a controller coupled to the storage device plurality hierarchy and capable of executing an that executes hierarchical storage management capability that and selectively controls access to the hierarchy of storage devices usage of storage according to distinct storage device type whereby hierarchically inferior storage is used for temporary storage.
2. (Currently Amended): The storage device according to Claim 1 wherein:
the storage array contains an hierarchy of storage devices of at least three distinct types and having that have a respective performance hierarchy.
3. (Currently Amended): The storage device according to Claim 1 further comprising:
the storage array contains an hierarchy of storage devices of at least three distinct types and having that have a respective economic or cost hierarchy.
4. (Currently Amended): The storage device according to Claim 1 further comprising:
a solid state cache and shared memory supplying storage as a distinct storage device type for a level of hierarchical storage.
5. (Currently Amended): The storage device according to Claim 1 further comprising:
~~relatively higher performance~~ Small Computer Systems Interface (SCSI) and/or Fibre Channel (FC) storage devices supplying storage as a distinct storage device type for a level of hierarchical storage.

6. (Currently Amended): The storage device according to Claim 1 further comprising:

~~relatively lower performance~~ Serial AT-attached (SATA) storage devices supplying storage as a distinct storage device type for a level of hierarchical storage.

7. (Currently Amended): The storage device according to Claim 1 further comprising:

a solid state cache and shared memory supplying storage as a distinct storage device type for a first level of hierarchical storage;

relatively higher performance Small Computer Systems Interface (SCSI) and/or Fibre Channel (FC) storage devices supplying storage as a distinct storage device type for a second level of hierarchical storage;

relatively lower performance Serial AT-attached (SATA) storage devices supplying storage as a distinct storage device type for a third level of hierarchical storage; and

a process executable in the controller allocates storage capacity of the SATA storage devices to low access customer data and to short-term and unpredictable storage usage.

8. (Original): The storage device according to Claim 7 further comprising:
an hierarchical storage management controller for usage within a disk array utilizing Fibre Channel (FC) and SATA disk drives and that allocates SATA storage as uncommitted and unstructured storage.

9. (Original): The storage device according to Claim 7 further comprising:
an hierarchical storage management controller for usage within a disk array utilizing Fibre Channel (FC) and SATA disk drives and that allocates SATA storage for intra-array and/or inter-array data transfers including logical unit (LUN) copies and snapshots.

10. (Currently Amended): A method of managing information storage in a storage system comprising:

enclosing an hierarchy of storage devices of at least three distinct types including volatile solid-state and non-volatile disk types in a single array and having a respective class hierarchy within a storage array; and selectively controlling information ~~access to the hierarchy of storage devices within the storage array~~ usage of storage according to distinct storage device type whereby hierarchically inferior storage is used for temporary storage.

11. (Currently Amended): The method according to Claim 10 further comprising: coupling an hierarchy of storage devices into the storage array including at least three distinct types having that have a respective performance hierarchy.

12. (Currently Amended): The method according to Claim 10 further comprising: coupling an hierarchy of storage devices into the storage array including at least three distinct types having that have a respective economic or cost hierarchy.

13. (Original): The method according to Claim 10 further comprising: combining an hierarchy of storage devices into the storage array including at least a volatile shared memory, a relatively higher performance non-volatile storage, and a relatively lower performance non-volatile storage.

14. (Original): The method according to Claim 10 further comprising: combining an hierarchy of storage devices into the storage array including at least a solid state cache and shared memory supplying storage for a first level of hierarchical storage, relatively higher performance Small Computer Systems Interface (SCSI) and/or Fibre Channel (FC) storage devices supplying storage for a second level of hierarchical storage, and relatively lower performance Serial AT-attached (SATA) storage devices supplying storage for a level of hierarchical storage.

15. (Original): The method according to Claim 14 further comprising: allocating storage capacity of the SATA storage devices to low access customer data and to short-term and unpredictable storage usage.

16. (Original): The method according to Claim 14 further comprising:
allocating SATA storage as uncommitted and unstructured storage.

17. (Original): The method according to Claim 14 further comprising:
allocating SATA storage for intra-array and/or inter-array data transfers including
logical unit (LUN) copies and snapshots.

18. (Currently Amended): A storage system comprising:
a disk array containing an hierarchy of disk adapters and coupled storage disks of at
least two types and having a respective class hierarchy; and
a controller coupled to the disk array and capable of executing an hierarchical storage
management capability that selectively controls access to the hierarchy of
disk adapters and coupled storage disks whereby hierarchically inferior
storage is used for temporary storage.

19. (Original): The storage system according to Claim 18 further comprising:
a cache memory coupled to the controller and operable as an additional storage in the
class hierarchy.

20. (Original): The storage system according to Claim 18 further comprising:
an hierarchy of storage devices having a respective performance hierarchy.

21. (Original): The storage system according to Claim 18 further comprising:
an hierarchy of storage devices having a respective economic or cost hierarchy.

22. (Original): The storage system according to Claim 18 further comprising:
a cabinet enclosing the disk array and the controller.

23. (Original): The storage system according to Claim 18 further comprising:
relatively higher performance Small Computer Systems Interface (SCSI) and/or Fibre
Channel (FC) disks supplying storage for a first level of hierarchical storage;
relatively lower performance Serial AT-attached (SATA) disks supplying storage for
a level of hierarchical storage; and

a process executable in the controller allocates storage capacity of the SATA disks to low access customer data and to short-term and unpredictable storage usage.

24. (Currently Amended): An article of manufacture comprising:
a controller usable medium having a computable readable program code embodied therein for managing a storage system, the computable readable program code further comprising:

a code capable of causing the controller to intercommunicate among an hierarchy of storage devices of at least three types including volatile solid-state and non-volatile disk types in a single array and having a respective class hierarchy within a storage array; and

a code capable of causing the controller to selectively control information access to the hierarchy of storage devices within the storage array whereby hierarchically inferior storage is used for temporary storage.

25. (Currently Amended): A storage system comprising:
means for coupling an hierarchy of storage devices of at least three types including volatile solid-state and non-volatile disk types in a single array and having a respective class hierarchy within a storage array; and
means for selectively controlling information access to the hierarchy of storage devices within the storage array whereby hierarchically inferior storage is used for temporary storage.
